

The Water Cycle (scrambled-stream test: read 1 to 8 in order)

1. Evaporation: the sun heats water into invisible vapor.
2. Condensation: rising vapor cools into clouds and fog.
3. Precipitation: heavy droplets fall as rain or snow.
4. Collection: water gathers in oceans and the cycle repeats.
5. Groundwater: water seeps down and is stored underground.
6. Transpiration: plants release water vapor from leaves.
7. Runoff: surface water flows downhill into rivers.
8. Human impact: cities and dams change how water moves.

Remediation notes

The notes below were written during the accessible rebuild of this document. They are part of the remediation record, not of the source document: they disclose every transformation, uncertainty, and omission the rebuild made.

1. The source uses two visual columns, but its title explicitly establishes numbered reading order from 1 through 8; preserve it as one ordered list.
