Perception Lab · inquiry report · Ambiguous cube

Report created: 10/6/2026, 6:38:14 AM

Open this file in a browser to read or print it. Both drawings and observations are fixed snapshots from this inquiry.

Setting to explore: Projected depth offset

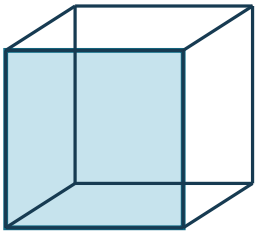
Both drawings use the same scale. The starting view keeps the settings captured at that moment.

2 drawing settings changed. Compare one setting at a time to separate their effects.

Starting and current drawings

Starting view

Ambiguous cube



Measurements: Hidden

Starting impression

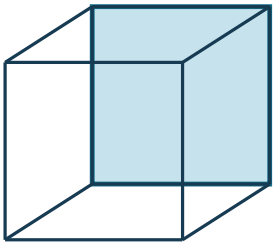
Unsure

Observation note

Captured cube observation

Current experiment

Ambiguous cube



Two depth interpretations

Measurements: Revealed

Current impression

Unsure

Observation note

Current necker observation

Drawing settings

All settings in the two snapshots

Setting	Starting view	Current
Projected depth offset	86 units	108 units
Surroundings	Visible	Visible
Face cue	Lower left face	Upper right face
Measurements	Hidden	Revealed

Changes from starting view

Setting	Starting view	Current
Projected depth offset	86 units	108 units
Face cue	Lower left face	Upper right face

The count describes drawing settings. A hidden grid or face cue may make a setting change invisible. Notes, impressions, and measurement guides are not counted.

> Measurement guide visibility also differs between the two snapshots. This difference is shown in the drawings and settings table, and is excluded from the drawing-setting count.

Compare your impressions

Which face seems closest, and does that impression stay steady?

These snapshots record your drawing settings and observations, not a score or proof of a general effect. A setting change may be invisible or may leave your impression unchanged. Viewing size and displays can affect what you see.
